Supplementary Figure 1. GFP expression analysis of brain from transgenic mice at P5. Littermate mice at P5 were obtained from a cross between the Odin-dPTB BAC transgenic line and wnt1-Cre mice and then GFP fluorescent image of the mid-sagittal section was analyzed for the indicated brains. Note that GFP was disappeared in the SCO and ependymal cells of the midbrain from the double transgenic mice (C and D).
Supplementary Figure 2. The ependymal cells lining the cerebral aqueduct of double transgenic mice are defective for the expression of S100β. Littermate mice at P5 were obtained from a cross between the Odin-dPTB BAC transgenic line and wnt1-Cre mice and then the mid-sagittal section of the indicated mice was subjected to immunohistochemical staining using anti-S100β antibody (green) to reveal mature ependymal cells.
